Problem 1) The chain rule of differentiation is written as follows:

$$
\begin{equation*}
\frac{d}{d x} f[g(x)]=g^{\prime}(x) f^{\prime}[g(x)] \tag{1}
\end{equation*}
$$

Therefore, considering that $\left(e^{x}\right)^{\prime}=e^{x}$, we will have

$$
\begin{gather*}
\frac{d}{d x}\left(e^{e^{x}}\right)=\left(e^{x}\right)\left(e^{e^{x}}\right)  \tag{2}\\
\frac{d}{d x}\left(e^{e^{e^{x}}}\right)=\left(e^{x}\right)\left(e^{e^{x}}\right)\left(e^{e^{e^{x}}}\right) . \tag{3}
\end{gather*}
$$
