

# Fast Optical Switch for Data Communication Applications

# - Overview -

- Data communication networks around the world use optical fibers because of the large bandwidth.
- Data routing is done by switch devices that interconnect different fibers.
- “Old way” switch converted the optical signal to electric then back to optic
  - Too slow when rate increases → bottle neck.
  - Very high energy consumption.

# - Optical switch -

## Function:

- Directly connects any N input fibers to N output fibers (NxN)
- Rate agnostic

## Usage:

- Data centers
- ROADM
- Network aggregation

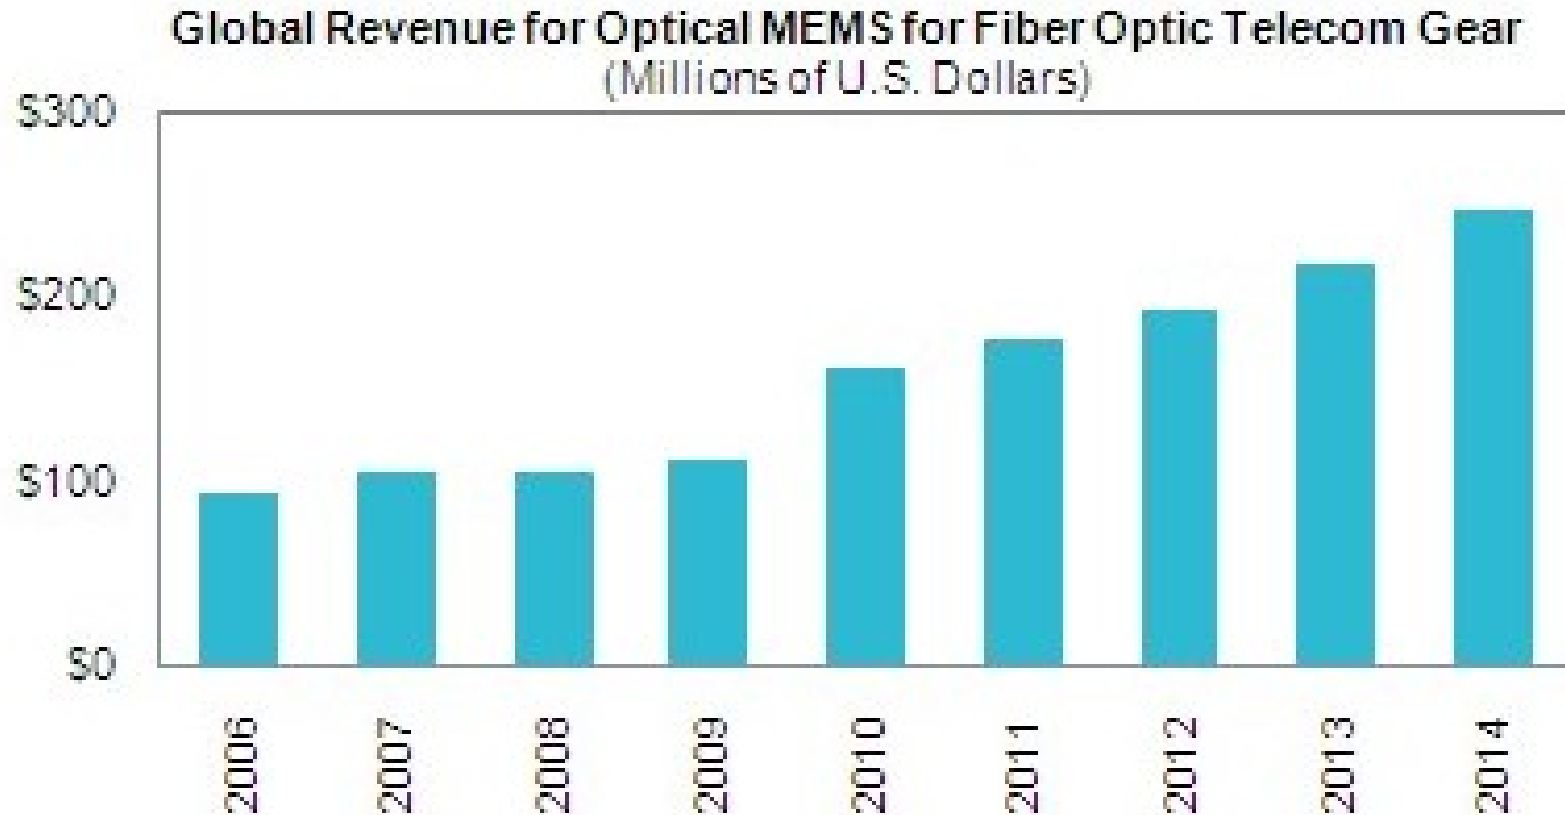

# - Market Drivers -

- Exponential increase of the data traffic due to cloud computing, mobile devices (tablets, smartphones), social networking.

Figures in legend refer to traffic share in 2016.  
Source: Cisco VNI Mobile, 2012

# - Optical switch market share -

# - Current technology -

- O-MEMS based
- Mirrors on gimbals mount
- Mirror reoriented to redirect the beam

# - Current technology -

## PROS

- Large number of port (320)
- Low insertion loss (3db)
- \$300-\$700 per port

## CONS

- Custom made element
- Millisecond response time
- Sensitive to vibration
- Sensitive to input energy
- Sensitive to failure
- Hinge failure (small MTBF)
- Power consumption (45W)
- \$300-\$700 per port

# -Our Approach-

O-MEMS → DMD

- 12  $\mu$ s switching time (vs 25 ms)
- Bistable (reduced power)
- Mass produced (cheap)
- Highly reliable ( $10^{12}$  flips)
- Large number of elements (1024x720)

- Used in projectors
- Television
- Medical/automotive display

How do you steer a beam with a binary device?

# -Our Approach II-

Reflection  $\rightarrow$  Diffraction

Holograms:

- Binary pattern
- Calculated by iterative Fourier transform
- Diffract light in deterministic way

Printed hologram

Diffraction

# -Our Approach III-

Reflection  $\rightarrow$  Diffraction

Hologram

DMD

Diffraction

- Robust (distributed information)
- Scalable (thousand of ports)
- Handle beam power (distributed energy)
- True non-blocking (all ports accessible)
- Addition/division functions (ROADM)

# -Our Approach III-

No exotic parts

# -Characterization-

Non-blocking ✓

All ports accessible 9x9 visible / 7x7 IR

Loss map per port

# -Characterization II-

Testbed insertion & video transmission ✓

# - Tech Comparison-

Vendor	Technology	Port count	Loss	speed	Power	Reliability
Calient	3D MEMS	High	Low	ms	45 W	Low
CrossFiber	3D MEMS	Low (1x8)	Low	ms	1W	Low
Polatis DirectLight	Micro-actuation	Moderate	Low	ms	128W	Good
Nistica*	DMD wavelength switch	High	Low	$\mu$ s	1W	High
UA	DMD Hologram	High	High Addressed in next phase	$\mu$ s	1W	High

\* The Nistica product is a wavelength switch (not space) using the DMD

# Loss budget

## 50% Fiber injection

- Analysis of the injection condition
- Solution found (replacing lens)

## 50% Diffraction

- Binary amplitude grating 10% efficiency
- 8 level phase grating 90% efficiency
- Require a piston DMD

- Competitive Advantage -
- Commercial Appeal -

## Disruptive technology !

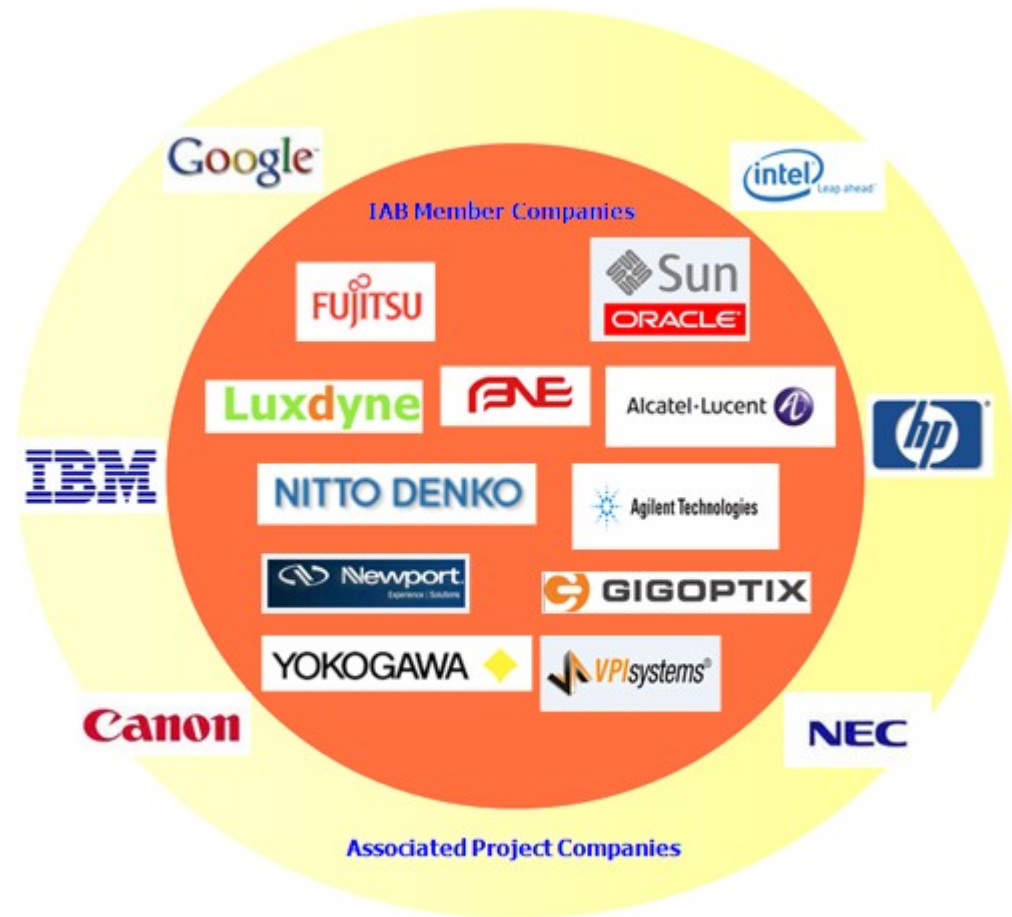

- Faster (100x)
- Scalable (1,000s of ports)
- Robust ( $10^{12}$  mirror cycles)
- Cheaper per port (<\$100)
- Low power consumption (1 Watt)

# - Commercial significance -

- Bill-Of-Material → manufacturing cost <\$100/port
- Preliminary Data Sheets
- Assessment of Packaging and Integration Options
- Interaction with
  - Texas Instrument
  - Fujitsu
  - Nistica
  - UCSD

# Next steps

<b>Metrics</b>	<b>Current</b>	<b>Phase 1</b>	<b>Phase 2</b>
Ports count	7x7	30x30	128x128
OSNR [db]	>8	>10	>100
Insertion loss [db]	36	16	5
Homogeneity [db]	5	3	1
Repeatability [db]	N.A.	0.5	0.1
Cross talk [db]	<-73	<-100	<-100
Speed [ $\mu$ s]	50	12	5
